MVP

What has to be true before Escape can run a day on this — customers booking, the shop working from the diary, the money still adding up.

The test it has to pass

> A customer books on their phone on Tuesday. On Saturday they arrive, the shop sees them in the diary, sits them down, rings them up, and that evening the drawer, the barber's commission and the owner's report all agree — with nobody typing anything twice.

Everything below is either needed for that sentence, or it is not in the MVP.

In

Customer

- ✓ Sign up and sign in with a phone number
- ✓ Book: service → barber or "any" → day → time → confirm
- ✓ See upcoming and past bookings
- ✓ Cancel within the shop's window
- ✓ Arabic and English, built for a phone

Shop

- ✓ Opening hours, per day, with closed days
- ✓ Service lengths, and which services may be booked online
- ✓ A diary for any day: book, move, arrived, no-show, cancel
- ✓ Booking rules: notice, buffer, how far ahead, slot grid
- ✓ Walk-ins in the same diary, with a live queue
- ✓ Ring up an appointment: it becomes the visit, once

Owner

- ✓ Nothing double-booked, ever (enforced on save)
- ✓ Money unchanged and still reconciling: drawer, card, InstaPay, commissions
- ○ Today at a glance: booked, walk-ins, completed, no-shows, takings

Out, on purpose

Not because they do not matter — because they are not needed for that Saturday to work.

Left out	Why, and when
SMS and WhatsApp reminders	Needs a paid provider and a sender identity. Phase 3, and the single best thing for no-shows
Loyalty, offers, reviews	Retention work. Worth doing once people are booking
Barber logins and their own screens	The shop runs the diary at first; barbers get screens in phase 3
Deposits and paying online	Needs a payment gateway and a refund policy. Later, if ever
Native apps in the stores	Phase 4, and needs your developer accounts
Forgot-password for customers	Needs SMS to be safe. Until then the shop can reset it
Multi-branch	The model allows it; nothing is built for it

Done means

Not "the screen exists". For each item:

- the rule is a tested function, not logic inside a screen;
- the server refuses what the screen refuses, independently;
- both languages read properly, right-to-left included;
- it has been run end to end against a real database, not only unit-tested;
- money touched by it still reconciles.

Where the MVP stands

The sentence at the top now holds: a customer books on their phone, the shop sees them in the diary, seats them from the queue, rings them up, and the money lands once — in the drawer, the commission and the report. What is left of the MVP is the owner's view of the day at a glance, and counting no-shows.
